	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● A command-line prompt asking the user to log their symptom status for the day (e.g., "Headache/Fog: Y/N"). ● Automatically fetch the current barometric pressure, temperature, and humidity for West Lafayette using a free weather API. ● Save the date, user's input, and the fetched weather data into a local .csv file. ● An "analyze" command that reads the .csv file and calculates the average barometric pressure on days with symptoms vs. days without.	**Schedule - (For V2.0+)** ● A feature to edit or delete previous entries if a mistake was made. ● A terminal-based ASCII chart that visually plots pressure trends over the last 7 days. ● Allowing the user to track multiple different specific symptoms
Not Important	**Delegate - (Use a library)**	**Delete - (Cut it)** ● Building a Graphical User

	• Use Java's built-in java.net.http.HttpClient to handle the web requests (instead of writing a custom HTTP client). • Use the free Open-Meteo API to get weather data (instead of writing a custom web scraper for Weather.com). • Use a library like Gson or org.json to parse the API's JSON response cleanly (instead of manually parsing the JSON)	Interface with buttons and menus. • A mobile app companion or SMS push notifications to remind you to log data. • Cloud database synchronization
